Mitigation Sheet	
Variable	Definition
Country	Name of country or region
R0	Basic Reproduction number (average number of secondary infection by a typical infection in an unconstrained epidemic and wholly susceptible population)
Strategy	"Unmitigated" = no intervention;
	"Social distancing whole population" = optimal outcome when epidemic is mitigated interventions to limit contacts in the general population including social distancing;
	"Enhanced social distance of elderly"= optimal outcome when epidemic is mitigated through interventions to limit contacts in the general population including social distancing, alongside enhanced social dista
Social_distance	Percentage reduction in contacts in the general population
	For "Unmitigated" this is 0
	For "Social distancing whole population" this reduction applies to the whole population
	For "Enhanced social distancing of elderly" this applies to just individuals under 70. For individuals 70 and above we assume a 60% reduction.
total_pop	Total population according to 2020 World Population Prospects (https://population.un.org/wpp/)
total_infected	Final total population infected by the end of the pandemic
total_death	Final total deaths by the end of the pandemic (assuming China-like age-severity profile and health system)
total_hospital	Final total individuals requiring hospitalisation by the end of the pandemic (assuming China-like age-severity profile)
total_critical	Final total individuals requiring critical care by the end of the pandemic (assuming China-like age-severity profile)
Suppression Sheet	
Variable	Definition
Country	Name of country or region
R0	Basic Reproduction number (average number of secondary infection by a typical infection in an unconstrained epidemic and wholly susceptible population)
Strategy	"Unmitigated" = no intervention
	"0.2 deaths per 100,000 per week trigger" = suppression triggered when weekly death rate reaches this threshold
	"1.6 deaths per 100,000 per week trigger" = suppression triggered when weekly death rate reaches this threshold
Social_distance	Proportional reduction in contact rate in general population modelled
total_pop	Total population according to 2020 World Population Prospects (https://population.un.org/wpp/)
total_infected	Final total population infected by the end of the pandemic.
total_death	Final total deaths by the end of the pandemic (assuming China-like age-severity profile and health system).
total_hospital	Final total individuals requiring hospitalisation by the end of the pandemic (assuming China-like age-severity profile)
peak_hospital_bed_demand	Number of hospital beds occupied at the peak of the epidemic (i.e. maximum demand/occupancy during the epidemic)
total_critical	Final total individuals requiring critical care by the end of the pandemic (assuming China-like age-severity profile)
peak_critical_bed_demand	Number of critical care beds occupied at the peak of the epidemic (i.e. maximum demand/occupancy during the epidemic)
	Note: these are derived from a stochastic, dynamical model rather than analytically as in the Mitigation worksheet and so there is a small difference between the two (typically <1%).
