Note:
 Urea is the end product of protein metabolism. It reflects on the functioning of the kidney in the body. Elevated levels are seen in pre-renal azotemia, renal disease, post-renal disease and reduced glomerular perfusion due to shock, dehydration, diarrhea etc. Decreased levels are seen in malnutrition, overhydration, liver disease etc.
 Uric Acid is the end product of protein metabolism. High levels are seen with Gout, inherited metabolic disorders of purine metabolism, excessive purine dietary intake and increased cell turnover. Only 10-15% patients with hyperuricemia have Gout.
 Creatinine is the product of creatine metabolism. It is a measure of renal function and elevated levels are observed in patients typically with 50% or greater impairment of renal function.
