characterized by low or high blood potassium levels. Chloride measurements are used in the diagnosis and treatment of electrolyte and metabolic disorders such as cystic fibrosis and diabetic acidosis

GLOMERULAR FILTRATION RATE (eGFR)

GLOMERULAR FILTRATION RATE (eGFR) 9 > 90.0 mL/min/1.73 m²
Method: Method Compensated Jaffe's reaction, IDMS traceable

REFERENCE RANGE IN DETAIL:

Kidney Damage with normal or high GFR: > 90 (Presence of Protein, albumin, cells or casts) Normal Kidney Function: > 90.00 (No proteinuria)

Mild decrease in GFR: 80 - 89

Moderate decrease in GFR: 30 - 59

Severe decrease in GFR: 15 - 29

Kidney failure < 15

Note: 1. National Kidney Disease Education program recommends the use of MDRD equation to estimate or predict GFR in adults (>=20 years) with Chronic Kidney Disease (CKD). 2. MDRD equation is most accurate for GFR <=60 mL/min/1.73m². 3. Recalculation of estimated GFR is required for African American race.

Interpretation :

Modification of diet in renal disease (MDRD) equation is most thoroughly validated and superior to all the other methods for estimation of GFR. It does not require weight as a variable and yields an estimated GFR normalized to 1.73m² body surface area. Using serum creatinine alone gives a poor inference of GFR because they are inversely related and effects of age, sex and race on creatinine production complicate interpretation. For African American races a modified formula is used for calculation of GFR.
