SURGICAL BIOPSY REPORT

CLINICAL HISTORY

Erythematous to violaceous plaque of 6x6cm over left cheek region extending upto left upper eyelid
Angiosarcoma

SPECIMEN

4mm punch biopsy of skin from face lesion

GROSS FINDINGS

Received 1 container labelled as "Nishamani" contains single skin attached tissue measuring 0.8x0.5x0.2 cm. A/E in 1

GROSSED BY

Dr Shameema, Dr Deepa

MICROSCOPIC FINDINGS

Skin punch biopsy consists of epidermis and dermis

Epidermis show irregular acanthosis, orthokeratosis

Dermis show diffusely infiltrating tumor comprising of atypical cells lining the vascular channels and cords which shows infiltration into dermal collagen

Individual tumor cells show moderate eosinophilic cytoplasm, moderate nuclear pleomorphism with prominent nucleoli

Occasional odd morphology is noted along with cytoplasmic hyaline globule formation

Surrounding stroma shows mixed inflammatory infiltrates comprising of lymphocytes, plasma cells and neutrophils

Hemosiderin laden macrophages also seen

Mitosis 3-4/10 HPF

Necrosis not seen

IMMUNOHISTOCHEMISTRY

Tumor cells are positive for CD31

ERG non contributory

Mib1 labeling index is 10-15% in the highest proliferating area

IMPRESSION

Skin punch biopsy from lesion over face- Angiosarcoma

The case is also seen by Dr Madhusmita Sety

AIYCO

RADIOLOGY

Patient Name : NISHAMANI BEHERA Visit No. : 16209688/06-01-2025
MRN : KIMS62501040031 Referral Doctor : Dr.JOGAMAYA PATTNAIK
Age/Sex : 59Y/F Hospital : KIMS HOSPITAL

CEMRI FACE & NECK

Clinical profile: ? skin malignancy , post 12 cycles of chemotherapy.

FINDINGS:

The study reveals a skin irregular thickening with associated well-defined enhancing cutaneous-subcutaneous nodular mass lesions in left cheek (measuring 19 x 13 mm and 12 x 7 mm in size). The lesion abuts the underlying maxillary bone with focal osseous thinning/scalloping. No intrasinus extension of lesion is seen.

Prominent left level Ib lymphnode seen measuring ~ 12 x 6.7 mm.

The bilateral parotid and submandibular glands are normal in size and attenuation.

No obvious soft tissue mass is seen in nasopharynx, oropharynx or hypopharynx. There is no airway narrowing.

The bilateral parapharyngeal spaces appear normal.

IMPRESSION: MR study reveals a skin irregularity with heterogeneously enhancing mass in left cheek region - consistent with recurrent/residual tumor.

Prominent left level Ib lymphnode

Suggest clinical & histopathological correlation.
